AUTHOR: Sedláček, J.

TITLE: Statistical Evaluation of Creep at Elevated Temperatures

PERIODICAL: Strojírenství, 1960, Vol. 10, No. 12,
pp. 895 - 900

TEXT: In view of the fact that the Larson-Miller equation is frequently viewed with suspicion the author carried out a detailed statistical analysis of this equation, using extensive experimental material (Newhouse, D.L., Seguin, B.R., Lape, E.M. "Some 12 Per Cent Chromium Alloys for 1 000 F to 1 200 F Operation", 1954, X, Transactions of the ASME). The experimental material covers over 50 creep tests. The main results of the analysis can be briefly summarised thus:

1) In the regression form

$$E(\log t) = a_1 X_1 + a_2 X_2 - C \quad (3).$$

The Larson-Miller equation provides satisfactory
Card 1/8

E073/E335

Statistical Evaluation of Creep at Elevated Temperatures

information on the interrelation of the absolute temperature, T , °K, the initial stress, σ_0 , kg/mm² and the time-to-failure or the time when the deformation reaches a certain limit value, t , hrs, since the correlation coefficient $|r_{Pc} \log \sigma|$ was always in excess of 0.80.

2) The dependence of the constant C on the stress or on the temperature has not been proved but in comparisons of the results of one series with another, the value differed considerably, i.e. it is not a constant, as was assumed in the original work of Larson and Miller ("A Time-Temperature Relationship for Rupture and Creep Stress", 1952, VII, Transactions of the ASME).

3) The interval of fluctuation of the t -values for the same constants and the same temperature was considerable, confirming the assumption of the author that the unreliability of the Larson-Miller equation is not due to the fact that its validity is limited but to the fact that internal creep

Card 2/8

Z/032/60/010/012/001/009
E073/E335

Statistical Evaluation of Creep at Elevated Temperatures

processes are strongly influenced by random factors. Therefore, it can hardly be expected that other parametric equations would enable a higher reliability of extrapolation than the Larson-Miller equation.

4) The requirement for higher reliability of the extrapolated value does not mean rejection of the Larson-Miller equation but requires better organisation of the experiments to encompass not only the influence of the temperature T and the stress σ on the changes in the time t but also the consequences of random internal processes which manifest themselves by variance in the duration t during repeated tests for the same values of T and σ .

The author of this paper gives a new method of evaluating creep which takes into consideration the latter conclusions; the hitherto not considered factor of probable reliability is taken into consideration. To a chosen combination of the values of stress and temperature (σ, T), a number of t_{pi} values will correspond, each of which can be

Card 3/8

Z/032/60/010/012/001/009
E073/E335

Statistical Evaluation of Creep at Elevated Temperatures guaranteed with a probability P_i . This means that the correct time-to-failure $t_s^{(\sigma T)}$ corresponding to the combination (σ, T) can be lower than the value t_{P_i} determined by means of the Larson-Miller equation solely on the basis of the probability $1 - P_i$. Thus extended, it is possible to express the creep properties including the reliability for reading-off and extrapolation of the t-values by using the following modified version of the Larson-Miller equation:

$$T(C_p + \log t_p) 10^{-3} = a_1(p) + a_2(p) \log \sigma \quad (2')$$

in which the coefficients C_p , $a_1(p)$ and $a_2(p)$ will be determined in such a way that the probability of exceeding the determined values $t_p^{(\sigma T)}$ from Eq. (2') by the values

Card 4/8

Z/032/60/010/012/001/009
E073/E335

Statistical Evaluation of Creep at Elevated Temperatures

$t_s^{(\sigma, T)}$ is very small and that approximately the following probability should apply:

$$\left[t_s^{(\sigma, T)} < t_p^{(\sigma, T)} \right] \approx 1 - p \quad (5')$$

choosing p in advance in accordance with requirements. The creep properties according to Eq. (2') can be expressed more clearly by the condition that the number of fractures which may occur below the value

$t_p^{(\sigma, T)}$ determined by means of Eq. (2') for a chosen (σ, T) in a series of tests under the same conditions would amount to a small fraction $(1 - p)$ of the total number of tests and with reference to a constant number of tests (100, 1 000, etc.) it should correspond to a certain insignificant

Card 5/8

Z/032/60/010/012/001/009
E073/E335

Statistical Evaluation of Creep at Elevated Temperatures

number of fractures even in the case of thousands of tests. Thus, if it is desired that Eq. (2') should enable determining t -values with a reliability of 99.9%, the coefficients C_p , $a_1(p)$ and $a_2(p)$ must be so determined that, for the read off value t_p , a fracture below the value t_p should occur only in one case out of 1 000, the test conditions remaining equal. Thus, a new factor is introduced in evaluating creep which takes into consideration random influences. The proposed statistical interpretation in accordance with Eqs. (2') and (5') is based on the requirement that the tests should conform to a system, the general form of which is expressed as follows:

Card 6/8

Z/052/60/010/012/001/009
E073/E335

Statistical Evaluation of Creep at Elevated Temperatures

$$(\sigma_1, T_1) \dots t_{11} \leq t_{21} \leq \dots \leq t_{r_1 1} \leq t_o^{(1)} + \\ + (n_1 - r_1) \text{ unfinished tests.}$$

$$(\sigma_2, T_2) \dots t_{12} \leq t_{22} \leq \dots \leq t_{r_2 2} \leq t_o^{(2)} + \\ + (n_2 - r_2) \text{ unfinished tests.}$$

$$(\sigma_k, T_k) \dots t_{1k} \leq t_{2k} \leq \dots \leq t_{r_{2k}} \leq t_o^{(k)} + \\ + (n_k - r_k) \text{ unfinished tests}$$

In this treatment much emphasis is placed on encompassing the main causes of the unreliability in evaluating the creep properties, i.e. the variance in t , and it is required that

Card 7/8

2/032/60/010/012/001/009
E073/E335

Statistical Evaluation of Creep at Elevated Temperatures

for each (G, T) combination the tests should be repeated a number of times. 16 creep tests are required as a minimum. The resulting method is based on the most frequently applied Larson-Miller equation, supplemented by the general theory of the service-life model which enables taking into consideration unforeseen random factors and delimiting the creep properties with a given degree of accuracy. The author also presents an introduction to a new concept of safety, based on the mathematical model of the service life. There are 2 figures, 1 table and 6 references: 3 Czech and 3 non-Czech.

SOURCE: Aplikace matematiky, v. 11, no. 1, 1966, 1-9

TOPIC TAGS: graphic technique, algorithm, matrix function, mathematic matrix, computer program

ABSTRACT: The article presents an algorithm for finding the quasicomponents (also called strong components) of any arranged graph. That problem arises in the solution of certain problems of an economic nature and applies in a certain sense to a more advantageous rearrangement of the rows and columns of a matrix of a high order. The program (written in Elliott-Autocode 803 A 103) is available from the Institute.

Title : The Influence of the Cerebral Cortex on Blood Clotting
Orig Pub : Univ. carolina. Med., 1956, 2, No 1, 3-23

Abstract : When massive blood loss was imitated in dogs a conditioned-reflex lengthening of clotting time was obtained as a result of thinning the plasma. In the generation of the conditioned reflex to injection of heparin, the conditioned reflex of lengthening clotting time (as a result of liberating the albumin component in the organism) was transformed at a definite stage into a reflex reducing clotting time, and then again into a reflex lengthening clotting time. When a hypertonic solution of NaCl was injected, a conditioned reflex was observed in which clotting time was shortened. These conditioned reflexes are

"Localization of Centers of Specialized Reflexes."

Prague, Activitas Nervosa Superior, Vol 5, No 3, July 63; pp 237-242.

Abstract [English summary modified]: In 33 28-day old rabbit fetuses, specialized reflexes to localized skin stimuli failed to appear following any of 3 different types of mesencephalic lesions, indicating integrative role of mesencephalic neurons. Results are tabulated in detail. Three anatomical diagrams, 4 tables; 5 Western, 4 Soviet and 3 Czech references.

TITLE: Development of the central nervous system in pre-natal life. [This paper was presented at the Third Interdisciplinary Conference on Experimental and Clinical Study of Higher Nervous Functions held in Marianske Lazne from 19 to 23 October 1964.]

SOURCE: Activitas nervosa superior, v. 7, no. 2, 1965, 122-123

TOPIC TAGS: biologic reproduction, central nervous system, experiment animal, brain, respiratory system, neuron, neurophysiology

ABSTRACT: Three problems were studied: 1. The development of a steady potential of brain hemispheres; this was studied in chick embryos, and it was found that the polarization of the brain hemispheres increased significantly during the second half of incubation. 2. The development of high-frequency impedance of brain tissue. This was studied in guinea pig foetuses; the changes were found to be very complicated. The results were found to be close to those for new-born guinea pigs. 3. The development of activity of respiratory centers. The experiments were made on rats. Only after 21st day of foetus life was it possible to increase the respiratory rate. In young rats recording of activity of bulbar reticular neurons was not successful before the 12th day; at that age response is similar to that of

of Isolated Mitochondria in Livers of Rats of Different Ages After
Partial Hepatectomy."

Prague, Ceskoslovenska Fysiologie, Vol 15, No 2, Feb 66, pp 130-131

Abstract: Experiments conducted on 36 male rats aged 3 to 24 months are described. Partial hepatectomy resulted in an increase of oxygen consumption, the succinate oxidase activity was decreased. Older rats that underwent a removal of 65-70% of the liver were able to modify their energy and material metabolism to such an extent that a nearly normal liver regeneration took place. 1 Figure, 5 Western, 1 Czech reference. Submitted at the Full Meeting of the Physiological Section of the Czechoslovak Medical Society of J.E.Purkyne at Hradec Kralove, 8 Sep 65.

Activity of Isolated Liver Mitochondria in Rats Irradiated With
1400 r Following Partial Hepatectomy."

Prague, Ceskoslovenska Fysiologie, Vol 15, No 2, Feb 66, pp 132-133

Abstract: The weight of the liver was reduced 65-70% by
hepatectomy, and the irradiation took place 6 hours later. Samples
were taken 42 hours after irradiation; during this period no food
was given to the rats. Irradiation did not influence the
changes in composition of the liver and its metabolism modifica-
tion resulting from the hepatectomy. 1 Figure, 5 Western,
2 Czech references. Submitted at the full Meeting of the
Physiological Section of the Czechoslovak Medical Society of
J.E.Purkyne, at Hradec Kralove, 6 Oct 65.

 ABSTRACT : The effect of various factors upon the process
 of curing the synthetic resin "Duracryl" which
 is used for dental prosthesis was studied. The
 degree of conversion of the monomer into the
 polymer was determined by titration of the
 residual monomer (methyl methacrylate) with
 a bromide-bromate mixture. It was established
 that the sharpest fall in the content of free
 monomer occurs during the first 8 hours after

TITLE: Additive processes with random jumps into the absorption barrier and their application to fatigue in metals

SOURCE: Aplikace matematiky, v. 11, no. 1, 1966, 26-44

TOPIC TAGS: stochastic process, material fracture, metal deformation, metal grain structure, mechanical fatigue

ABSTRACT: The paper deals with the theoretical foundations of the statistical interpretation of fracture phenomena in metals using stochastic process theory. The main interest is concentrated on the nature of fracture phenomena, for example, on the process of damage accumulation, the stochastic interpretation of which enables the real nature of the fracture mechanism to be expressed. At the same time an attempt is made to relate the stochastic development of successive damage of the metallic structure to the external loading processes. This approach makes possible the solution of more general problems dealing with the fatigue of structural components while in service.

TITLE: Review of the uses, methods and practical examples of statistical checks in the Czechoslovak Machine Building Industry

PERIODICAL: Pomiary-Automatyka-Kontrola, no. 9, 1960, 361 - 366

TEXT: This review constitutes a report presented at a conference on SQC in Warsaw on September 22 and 23, 1959, and is a general summary of SQC activities in the Czechoslovak industry during the period 1949 - 1959. The summary comprises: I. High-precision SQC in time-piece manufacture, ball bearing manufacture and, to some extent, in automobile production; II SQC in consumer goods manufacture (needles, slide fasteners, dental drills, toys, razor blades, etc); III SQC in non-mechanical operations (rubber calendering, enameled wire and conventional conductor wire production) where statistical methods are used to control material consumption instead of quality; IV SQC in heavy machine building industries, where statistical control is restricted to checking operations proper instead of quality itself; V SQC in foundries and VI SQC in acceptance tests. Three major factors are mentioned which impair the progress of SQC in the ČSR: poor knowledge of SQC ✓
